MRI CONTRAST FORM

DOB:// AGE:	/ SEX:	

Your doctor has asked that your symptoms be evaluated with an MRI study with gadolinium intravenous contrast. Gadolinium contrast is given by injection into a vein and helps provide the radiologist with additional information that may not be available without intravenous contrast.

The gadolinium contrast agent you will receive has been approved as safe and effective by the U.S. Food and Drug Administration (FDA). As with any medication, a small chance exists that you may have a reaction to it. Minor and temporary reactions include pain at the injection site, nausea, headache, dizziness, itching, rash or hives. Rarely, a true allergic reaction may occur (including facial swelling, difficulty breathing, or low blood pressure) requiring treatment. The odd of an extremely severe reaction, including death, is very rare. There is also an extremely rare disease called Nephrogenic Systemic Fibrosis that has occurred in patients with kidney failure. As such, we screen at-risk patients by obtaining kidney function studies prior to contrast injection.

Your chances of a reaction may be increased if you have had a previous allergic reaction to gadolinium, are allergic to other drugs or foods, have asthma, or suffer from kidney disease. Please inform the MR technologist if any of these situations apply to you.

Please answer the questions below.

Please list all allergies:
